"Studies find significant spillover effects, where volatility in cryptocurrency markets transmits to traditional asset classes like equities and commodities. More recent structural models confirm this transmission occurs by affecting overall investor risk appetite and that it extends to the broader macroeconomy, with a notable impact on long-term inflation. This demonstrates a concrete channel through which cryptocurrency bubbles and crashes can have broader economic consequences. It has been suggested by Lee Reiners, a former Federal Reserve

economist, that "when this crypto bubble bursts — and it will burst — it will end up impacting people across the economy even if they don't have direct investment in crypto". "Even as private companies and corporations have worked to have such services contracted out to or privatized by them, others have worked to have these turned over to non-profit organizations or associations. From the 1970s to the 1990s, there was deregulation of some industries, like banking, trucking, airlines and telecommunications, which resulted generally in more competition and lower prices. According to the Cato Institute, an American libertarian think-tank, in some cases deregulation in some aspects of an industry were offset by increased regulation in other aspects, the electricity industry being a prime example. For example, in banking, Cato Institute believes some deregulation allowed banks to compete across state lines, increasing consumer choice, while an actual increase in regulators and regulations forced banks to make loans to individuals incapable of repaying them, leading eventually to the 2008 financial crisis. One example of economic decentralization, which is based on a libertarian socialist model, is decentralized economic planning. Decentralized planning is a type of economic system in which decision-making is distributed amongst various economic agents or localized within production agents."
