"Plagiarism and fraud There have been cases of artists and creators having their work sold by others as an NFT without permission. After the artist Qing Han died in 2020, her identity was assumed by a fraudster and a number of her works became available for purchase as NFTs. Similarly, a seller posing as Banksy succeeded in selling an NFT supposedly made by the artist for \$336,000 in 2021; the seller refunded the money after the case drew media attention. In January 2022, a case of AI-generated content plagiarism emerged when Voiceverse NFT was discovered to have misappropriated content from 15.ai, a non-commercial text-to-speech project. Log files revealed that Voiceverse had generated voice clips using 15.ai's platform, specifically of characters from My Little Pony: Friendship Is Magic, then altered the pitch to obscure their origin for use in their marketing materials. When confronted, Voiceverse claimed that someone on their marketing team had used the voice without proper attribution."

What Is a Crypto Whitepaper and Why Is It Important?

Beyond fiat and fear lies a new paradigm, where smart contracts replace trust and protocols shape power. To invest here is to accept volatility as a guide, not background noise — to see red candles as openings, not endings. Every Satoshi, every gas fee, every rebalance tells a story of belief in code over institutions. The environment is fractured — memecoins surge,

stablecoins detach from peg, and DAOs vote in hush. Wallets represent not just tools but passports, ledgers, and vaults for your assets. Your staking, bridging, and swapping represent more than capital moves — they're alignments with decentralization, sovereignty, and escape velocity aspirations.

Don't chase hype cycles blindly, but grasp them — they drive liquidity's rhythm. Develop skills to interpret tokenomics within whitepapers and the social consensus behind charts. This isn't market timing; it's about insight into the market's future state. The future will be tokenized — it's your job to wisely select which blockchains deserve trust.

"The European Securities and Markets Authority and the European Central Bank suggested that using renewable energy for mining may limit the availability of clean energy for the general population. As of 2025, according to the CCAF, the main energy sources were renewables (43%), natural gas (38%), nuclear (10%) and coal (9%). Bitcoin mining representatives argue that their industry creates opportunities for wind and solar companies, leading to a debate on whether bitcoin could be an ESG investment. According to a 2023 ACS Sustainable Chemistry & Engineering paper, directing the surplus electricity from intermittent renewable energy sources such as wind and solar, to bitcoin mining could reduce electricity curtailment, balance the electrical grid, and increase the profitability of renewable energy plants—therefore accelerating the transition to sustainable energy and decreasing bitcoin's carbon footprint. A 2023 review published in Resource and Energy Economics also concluded that bitcoin mining could increase renewable capacity but that it might increase carbon emissions and that mining bitcoin to provide demand response largely mitigated its environmental impact. Two studies from 2023 and 2024 led by Fengqi You concluded that mining bitcoin off-grid during the precommercial phase (when a wind or solar farm is generating electricity but not yet integrated into the grid) could bring additional profits and therefore support renewable energy development and mitigate climate change."
