Consider this your onboarding to digital sovereignty through capital allocation.

"It provides an open-source software development kit called Polkadot SDK that can be used by development teams to build their own blockchains. These blockchains can function independently, known as "solochains," or integrate into the Polkadot network as "parachains," thereby benefiting from shared security and cross-chain communication capabilities. Sovereignty, shared security and interoperability Polkadot offers three properties to parachains: sovereignty, shared security and interoperability. Sovereignty refers to the idea

that individual blockchains are sovereign in the way they conduct themselves. Blockchains define their own rules for how users can interact on them. Each parachain maintains autonomy over its governance and transaction processing, allowing it to define its own rules and optimize for specific functionalities without being constrained by the decisions or limitations of other chains."

"These fees are determined by the transaction's size and the amount of data stored, measured in satoshis per byte. The proof of work system and the chaining of blocks make blockchain modifications very difficult, as altering one block requires changing all subsequent blocks. As more blocks are added, modifying older blocks becomes increasingly challenging. In case of disagreement, nodes trust the longest chain, which required the greatest amount of effort to produce. "The Times identified six "environmentally friendly" cryptocurrencies: Chia, IOTA, Cardano, Nano, Solarcoin and Bitgreen. Academics and researchers have used various methods for estimating the energy use and energy efficiency of blockchains. A study of the six largest proof-of-stake networks in May 2021 concluded: Cardano has the lowest electricity use per node; Polkadot has the lowest electricity use overall; and Solana has the lowest electricity use per transaction. In terms of annual consumption (kWh/yr), the figures were: Polkadot (70,237), Tezos (113,249), Avalanche (489,311), Algorand (512,671), Cardano (598,755) and Solana (1,967,930). This equates to Polkadot consuming 7 times the electricity of an average U.S. home, Cardano 57 homes and Solana 200 times as much. The research concluded that PoS networks consumed 0.001% the electricity of the bitcoin network."
