"Others have proposed changes to bitcoin that would reform the block format in a backward-incompatible way. For example, FlexTrans (Flexible Transactions) would make transactions smaller by changing how they are described to a "tag" system, allowing more transactions per block. This is not compatible with systems that do not upgrade. Malleability A transaction uses unused outputs from a previous transaction(s) known as unspent transaction

outputs (UTXO). This results in a chain of related transactions linked by their transaction identifier.
